Standard Chemical Thermodynamic Properties of Alkylbenzene Isomer Groups

Robert A. Alberty

Department of Chemistry, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139

The chemical thermodynamic properties of alkylbenzene isomer groups from C_8H_{10} to C_9H_{12} in the ideal gas phase have been calculated from 298.15 to 1000 K from tables of Stull, Westrum, and Sinke. In the absence of literature data on all isomers of higher isomer groups, the properties of isomers of $C_{10}H_{14}$ to $C_{12}H_{18}$ have been calculated using Benson group values. For isomer group properties, increments per carbon atom have been calculated to show the extent to which thermodynamic properties of higher isomer groups may be obtained by linear extrapolation. Equilibrium mole fractions within isomer groups have been calculated for the ideal gas state from 298.15 to 1000 K. Values of C_p° , S° , $\Delta_f H^{\circ}$, and $\Delta_f G^{\circ}$ are given for all species from C_6H_6 to $C_{12}H_{18}$ in joules for a standard state pressure of 1 bar.

Key words: alkylbenzenes; Benson method; enthalpy of formation; entropy; Gibbs energy of formation; heat capacity; isomer group thermodynamic properties; isomer mole fractions; thermodynamic properties.

luene, the number of isomeric species increases very rapidly with carbon number. It is therefore convenient to calculate chemical thermodynamic properties for alkylbenzene isomer groups and use these properties in equilibrium calculations, as recommended by Smith.¹ The mole fractions of individual species may then be calculated in a second step since their mole fractions in their isomer groups are functions of temperature only for ideal gases.

The preceding article² in this series has presented chemical thermodynamic properties of alkane isomer groups through C₁₀H₂₂ for the ideal gas state from 200 to 1500 K. These tables provide a basis for extrapolation to higher carbon numbers.

The first statistical-mechanical correlations of the chemical thermodynamic properties of the alkylbenzenes were made by Pitzer and Scott.³ Prosen, Johnson, and Rossini⁴ computed a number of enthalpies of formation of alkylbenzenes and developed an extrapolation formula. Taylor, Wagman, Williams, Pitzer, and Rossini⁵ made statistical mechanical correlations for the four C₈H₁₀ and the eight C₉H₁₂ alkylbenzenes. Further work was done by Rossini, Pitzer, Arnett, Braun, and Pimentel,⁶ who published tables in 1953. Some further small changes were made by Stull, Westrum, and Sinke⁷ in publishing their book in 1969. The enthalpies of formation of alkylbenzenes at 298.15 K have been evaluated by Cox and Pilcher,⁸ and the thermodynamic properties of the C₁₀H₁₄ alkylbenzenes at 298.15 K have been presented by Somayajulu.⁹

2. Standard Thermodynamic Properties of Isomer Groups

When isomers are in chemical equilibrium, it has been known for some time^{1,10-16} that they can be aggregated in calculations of equilibrium mole fractions by use of the standard Gibbs energy of formation $\Delta_f G^\circ(I)$ of the isomer group defined by

$$\Delta_f G^\circ(I) = -RT \ln \left[\sum_{i=1}^{N_I} \exp(-\Delta_f G_i^\circ/RT) \right], \quad (1)$$

where $\Delta_f G_i^\circ$ is the standard Gibbs energy of formation of an individual isomer and N_I is the number of isomers in the group, including stereoisomers. The equilibrium mole fractions r_i of various isomers in a group can be calculated using

$$r_i = \frac{y_i}{y_I} = \exp \{ [\Delta_f G^\circ(I) - \Delta_f G_i^\circ]/RT \}, \quad (2)$$

where y_I is the sum of the mole fractions of the individual isomers. The corresponding equations for the other standard thermodynamic properties $C_P^\circ(I)$, $S^\circ(I)$, and $\Delta_f H^\circ(I)$ can be derived by differentiating Eq. (1) with respect to temperature.¹⁶ When standard Gibbs energies of formation of isomer groups are used to calculate equilibrium constants for reactions of ideal gases, the equilibrium expression is written in terms of equilibrium mole fractions of isomer groups.

For the alkylbenzenes the standard chemical thermodynamic properties for an isomer group are interrelated by

$$\begin{aligned} \Delta_f G^\circ(I) &= \Delta_f H^\circ(I) - T [S^\circ(I) \\ &\quad - nS_{\text{graphite}}^\circ - (n-3)S_{\text{H}_2\text{g}}^\circ], \end{aligned} \quad (3)$$

where n is the number of carbon atoms.

To calculate the chemical thermodynamic properties for an isomer group, a term must be included for each molecular species, including stereoisomers. The numbers of chiral centers and isomers of the alkylbenzenes are shown in Table 1. Rather than having a line in a thermodynamic table for each stereoisomer, this article follows the standard practice of giving properties of racemates. Thus $R \ln 2$ is added to the

Table 1. Numbers of isomers of alkylbenzenes

| | Number of lines | Chiral Centers | Total isomers |
|--------|-----------------|----------------|---------------|
| | One | Two | |
| C6H6 | 1 | 0 | 1 |
| C7H8 | 1 | 0 | 1 |
| C8H10 | 4 | 0 | 4 |
| C9H12 | 8 | 0 | 8 |
| C10H14 | 22 | 1 | 23 |
| C11H16 | 40 | 6 | 46 |
| C12H18 | 87 | 20 | 109 |

calculated standard entropy and $RT \ln 2$ is subtracted from the standard Gibbs energy of formation of one of the chiral forms at each temperature. Therefore, the numbers of lines in tables in this article do not correspond to the total numbers of isomers; the numbers of lines and of isomers are compared in Table 1.

Stull, Westrum, and Sinke⁷ give data on all the isomers through C₉H₁₂ and on 7 of the 23 isomers of C₁₀H₁₄. In order to compare the properties expected for the remaining isomers of C₁₀H₁₄ and to examine the relationship between isomer group properties and carbon number, the Benson group method was used.

3. Calculations of Standard Thermodynamic Properties of Alkylbenzenes Using the Benson Method

In view of the rapid increase in the number of isomers with carbon number, we are dependent on various estimation and extrapolation methods for thermodynamic properties of higher isomers. Calculations using the Benson method^{17,18} were useful in considerations of the properties of the higher alkanes,² and they are needed for the alkylbenzenes because the increments in isomer group thermodynamic properties are still increasing with carbon number at C₉H₁₂. Therefore the Benson method was used to estimate C_P° , S° , $\Delta_f H^\circ$, and $\Delta_f G^\circ$ for all the individual isomers of the alkylbenzenes up to C₁₂H₁₈ in the ideal gas state using computer programs written in APL.²

In order to make these calculations, the structure of each alkylbenzene species was divided into the following Benson groups: C(H)₃(C), C(H)₂(C)₂, C(H)(C)₃, C(C)₄, C(C_B)(C(H))₂, C(C_B)(C)₂(H), C(C_B)(C)₃, C_B(H), and C_B(C). In addition the total symmetry number (TSN), number of optical isomers (OPT), and ortho corrections were identified. In view of some of the uncertainties in some of the alkylbenzene group values indicated by Benson, the gauche and 1,5-H repulsions, which affect only several of the most highly branched species were omitted. In calculating symmetry numbers a report by Davies, Syverud, and Steiner¹⁹ was very helpful. The group assignments were checked by matrix multiplication to be sure they accounted for the correct numbers of carbon and hydrogen atoms.

The matrix of numbers of contributions was then matrix multiplied by a matrix of the Benson values to obtain for each isomer the sum of the contributions to $\Delta_f H_{298}^\circ$, $S_{\text{int } 298}^\circ$,

C_p° , C_p° , C_p° , C_p° , C_p° , C_p° , and C_p° . In further steps in the calculation the heat capacity values were fit to the equation

$$C_p^{\circ} = \alpha + \beta T + \gamma T^2, \quad (4)$$

using the least-squares criteria, and the values of α , β , and γ were used to calculate C_p° , S° , and $\Delta_f H^{\circ}$ from 200 to 1000 K.

$$S^{\circ} = S_0^{\circ} + \alpha \ln T + \beta T + (\gamma/2)T^2 - R \ln(TSN/OPT), \quad (5)$$

$$\begin{aligned} \Delta_f H^{\circ} &= \Delta_f H_0^{\circ} + \alpha T + (\beta/2)T^2 \\ &\quad + (\gamma/3)T^3 - n(H^{\circ} - H_{298}^{\circ})_{\text{graph}} \\ &\quad - (n-3)(H^{\circ} - H_{298}^{\circ})_{\text{H}_2}. \end{aligned} \quad (6)$$

The values of $\Delta_f G^{\circ}$ at various temperatures were then calculated using Eq. (3).

Table 2 shows how well the chemical thermodynamic properties calculated using the Benson method agree with the values from Stull, Westrum, and Sinke⁷ for C₆H₆ through C₉H₁₂ and for the seven isomers of C₁₀H₁₄ for which they give values. The differences between the literature and estimated values at each temperature were squared, divided by the number of pairs of values, and the square root was taken. For C₆H₆ and C₇H₈ this yields the magnitudes of the deviations, and for the higher homologous series it yields the root-mean-square deviations as a function of temperature. Even for the higher homologs the root-mean-square deviations in $\Delta_f G^{\circ}$ average less than 2 kJ mol⁻¹.

4. Tables of Standard Thermodynamic Properties of Alkylbenzene Isomer Groups

Since the International Union of Pure and Applied Chemistry has recently recommended that thermodynamic data be given in SI units for a standard state pressure of 1 bar

(10⁵ Pa), this has been done for the tables in this article. The change in standard state pressure from 1 atm to 1 bar does not affect C_p° and $\Delta_f H^{\circ}$, but the standard entropy of an ideal gas is increased by

$$R \ln(1.013 25) = 0.109 \text{ J K}^{-1} \text{ mol}^{-1}$$

at any temperature and the standard Gibbs energy of formation is reduced by $[RT \ln(1.013 25)]\delta$, where δ is the net increase ($4-n$) in moles of gas in the formation reaction.²⁰

In Tables 3 to 8, the Stull, Westrum, and Sinke tables have been used to calculate the isomer group properties for C₆H₆ to C₉H₁₂, and the Benson method has been used to calculate the isomer group properties for C₁₀H₁₄ to C₁₂H₁₈. For each property the increments in going from one carbon number to the next are provided. These increments provide a basis for a linear extrapolation of standard thermodynamic properties of alkane isomer groups to higher carbon numbers. In a general way we would expect these increments to approach constant values as the carbon number increases at constant temperature. At lower temperatures, constant values are not approached for some properties, and this indicates that extrapolations are correspondingly uncertain. The limiting increments per carbon atom are quite similar to those for the alkanes, but there are some differences.² The limiting increments in $\Delta_f H^{\circ}(I)$ are about 5 kJ mol⁻¹ more negative for the alkylbenzenes than for the alkanes above 500 K. The increments in $C_p^{\circ}(I)$ and $S^{\circ}(I)$ are remarkably similar for the two homologous series above 400 K.

Table 7 gives

$$H^{\circ}(I, T) - H^{\circ}(I, 298.15 \text{ K}),$$

the standard enthalpy for an isomer group relative to the isomer group at 298.15 K. Table 8 gives values for

$$H^{\circ}(I, T) - H^{\circ}(I, 298.15 \text{ K}) + \Delta_f H^{\circ}(I, 298.15 \text{ K}),$$

the standard enthalpy for the isomer group relative to the

elements at 298.15 K. This quantity allows the direct calculation of heat effects when the reactants and products are at different temperatures.

5. Equilibrium Mole Fractions Within Alkylbenzene Isomer Groups

The equilibrium mole fractions within isomer groups calculated from standard Gibbs energies of formation are given in Table 9 for the ideal gas state. Since the uncertainties in $\Delta_f G^\circ$ (I) and $\Delta_f G^\circ$ are about the same, the uncertainty in the difference is nearly independent of the relative values of the two parameters, but the absolute uncertainty does increase with temperature. Since the nearly constant uncertainty is in the exponent in the calculation, the equilibrium mole fractions of the isomers at a given temperature are uncertain by the same factor, whether they are large or small. The usual equation for the propagation of variance indicates that the equilibrium mole fractions are uncertain by about 15% at the lower temperature and 10% at the higher temperatures. This makes it difficult to indicate the uncertainties in the table. It could be done by using exponential notation, but this makes it difficult to compare the mole fractions of various isomers.

Compounds are named in tables according to the IUPAC Revised and Collected Recommendations for the Nomenclature of Organic Chemistry, 1978.²¹ For example, the two forms of 1-methylpropylbenzene are represented by 1R and 1S, and the racemic mixture is represented by 1(RS)-methylpropylbenzene. In naming species with two or more ring hydrogens substituted, the name of the largest substituent is given first to clarify the relationships between the various structural isomers.

Table 9 shows that in general the more highly branched isomers have very low equilibrium mole fractions at any temperature. The isomers with more methyl groups, and

more branches have more positive standard Gibbs energies of formation. At higher temperatures there is in general a more even distribution of the mole fractions between the less branched isomers, reflecting the fact that entropies are more similar than the enthalpies of formation.

It is of interest to note that if certain isomers are excluded by the catalyst, the equilibrium mole fractions of the remaining isomers may be calculated from these tables by simply excluding certain isomers and renormalizing the total mole fraction to unity. The calculation of the standard Gibbs energy of formation of the restricted isomer group is more complicated. If the standard Gibbs energy of formation of the restricted isomer group (RIG) that is in equilibrium is represented by $\Delta_f G^\circ$ (RIG) and the standard Gibbs energy of formation of the excluded isomer group (EXCLIG) is represented by $\Delta_f G^\circ$ (EXCLIG), then the standard Gibbs energy of formation of the whole isomer group and of the restricted isomer group are given by the following equations:

$$\begin{aligned} \exp[-\Delta_f G^\circ(I)/RT] &= \exp[-\Delta_f G^\circ(\text{RIG})/RT] \\ &+ \exp[-\Delta_f G^\circ(\text{EXCLIG})/RT], \end{aligned} \quad (7)$$

$$\begin{aligned} \Delta_f G^\circ(\text{RIG}) &= -RT \ln \{ \exp[-\Delta_f G^\circ(I)/RT] \\ &- \exp[-\Delta_f G^\circ(\text{EXCLIG})/RT] \}. \end{aligned} \quad (8)$$

6. Standard Thermodynamic Properties of Individual Alkylbenzene Species

The values of C_p° , S° , $\Delta_f H^\circ$, and $\Delta_f G^\circ$ for all the alkylbenzene species through $C_{12}H_{18}$ are given in Tables 10 to 13 in joules for a standard state pressure of 1 bar. The values for C_6H_6 through C_9H_{12} have been converted from the tables of Stull, Westrum, and Sinke,⁷ and the values for $C_{10}H_{14}$ through $C_{12}H_{18}$ have been calculated using the Benson method.¹⁸ The values for chiral forms are for the racemates.

7. Discussion

The values of standard thermodynamic properties of isomer groups given here may be used in predicting equilibrium compositions of organic systems at temperature-catalyst conditions where species in an isomer group are in equilibrium. They also provide a basis for extrapolation to estimate the standard thermodynamics properties of higher isomer groups. As the carbon number increases, the equilibrium mole fractions of individual molecular species become of less interest because there are so many of them and because gas chromatographic analytical methods yield mole fractions of isomer groups, rather than individual isomers, at higher carbon numbers.

The distribution of species within an isomer group is independent of pressure for ideal gases and is only a function of temperature, and so it is of interest to note that if any alkylbenzene species (or isomer group) is exposed to a catalyst of disproportionation and isomerization reactions, the equilibrium distribution is similarly independent of pressure for ideal gases and is only a function of temperature. Actually this statement applies to any initial mixture of alkylbenzenes. The reason is that the disproportionation reactions,

do not involve a change in the number of moles of gas. Calculations of equilibrium mole fractions of alkylbenzene mixtures at various H/C ratios for the mixture provide an illustration of the usefulness of data on isomer groups.²²

8. Nomenclature

| | |
|--|--|
| C_P° | = standard heat capacity at constant pressure of isomer i , $J K^{-1} mol^{-1}$ |
| $C_P^{\circ}(I)$ | = standard heat capacity at constant pressure of isomer group I, $J K^{-1} mol^{-1}$ |
| $\Delta_f G_i^{\circ}$ | = standard Gibbs energy of formation of isomer i , $kJ mol^{-1}$ |
| $\Delta_f G^{\circ}(I)$ | = standard Gibbs energy of formation of isomer group I, $kJ mol^{-1}$ |
| $H^{\circ}(I, T) - H^{\circ}(I, 298.15 K)$ | = standard enthalpy for isomer groups relative to isomer groups at 298.15 K, $kJ mol^{-1}$ |
| $H^{\circ}(I, T) - H^{\circ}(I, 298.15 K) + \Delta_f H^{\circ}(I, 298.15 K)$ | = standard enthalpy for isomer groups relative to elements at 298.15 K, $kJ mol^{-1}$ |
| $\Delta_f H_i^{\circ}$ | = standard enthalpy for isomer i , $kJ mol^{-1}$ |
| $\Delta_f H^{\circ}(I)$ | = standard enthalpy of formation of isomer group I, $kJ mol^{-1}$ |
| n | = number of carbon atoms in a molecule |
| N_I | = number of isomers in an isomer group |
| OPT | = number of optical isomers |
| r_i | = equilibrium mole fraction of species i in an isomer group |

| | |
|----------------|---|
| S_i° | = standard entropy of isomer i , $J K^{-1} mol^{-1}$ |
| $S^{\circ}(I)$ | = standard entropy of isomer group I, $J K^{-1} mol^{-1}$ |
| TSN | = total symmetry number |
| y_i | = mole fraction of isomer i within the isomer group |
| y_I | = mole fraction of isomer group I in a mixture |

9. Acknowledgments

I am indebted to Catherine Gehrig for checking the Benson group assignments, to Lillian Alberty for assistance with programming, and to Frederick D. Greene II for advice on organic nomenclature. The calculations in this paper were made using a terminal connected to the IBM 370/3033N in the MIT Computer Center. Programs were written in APL and tables were printed on a Xerox 8700 Printer in the Computer Center. This research was supported by a grant from the National Bureau of Standards.
