Thermodynamics of Enzyme-Catalyzed Reactions: Part 2. Transferases

Robert N. Goldberg and Yadu B. Tewari

Biotechnology Division, National Institute of Standards and Technology, Gaithersburg, Maryland 20899

Received February 17, 1994; revised manuscript received April 14, 1994

Equilibrium constants and enthalpy changes for reactions catalyzed by the transferase class of enzymes have been compiled. For each reaction the following information is given: the reference for the data; the reaction studied; the name of the enzyme used and its Enzyme Commission number; the method of measurement; the conditions of measurement [temperature, pH, ionic strength, and the buffer(s) and cofactor(s) used]; the data and an evaluation of it; and, sometimes, commentary on the data and on any corrections which have been applied to it or any calculations for which the data have been used. The data from 285 references have been examined and evaluated. Chemical Abstract Service registry numbers are given for the substances involved in these various reactions. There is a cross reference between the substances and the Enzyme Commission numbers of the enzymes used to catalyze the reactions in which the substances participate.

Key words: apparent equilibrium constants; chemical thermodynamics; enthalpies of reaction; enzyme-catalyzed reactions; evaluated data; transferases

1. Introduction

The first paper in this series¹ dealt with the thermodynamics of the oxidoreducataxes, the first class of enzymes classified by the Nomenclature Committee of the International Union of Biochemistry.² In the current paper a critical compilation of thermodynamic data is provided for the second class of enzymes—the transferases. The reactions catalyzed by these enzymes play significant roles in metabolic processes such as glycolysis, oxidative phosphorylation, glycogen and starch synthesis, and also in the action of muscles. The data presented herein are limited to equilibrium and calorimetric measurements performed on these reactions under *in vitro* conditions. Thus, the thermodynamic quantities which are given are apparent equilibrium constants K' and calorimetric enthalpies of reaction Δ_H^{cal} . Apparent equilibrium constants calculated from kinetic data are also tabulated. If the change in hydrogen ion binding $\Delta_N(H^+)$ for a biochemical reaction is known, the standard transformed enthalpy of reaction Δ_H° can be calculated from the calorimetric enthalpy of reaction.³ Equilibrium constants K and standard molar enthalpies of reaction Δ_H° for chemical reference reactions are also given if they have been reported in

the literature. The standard transformed enthalpy of reaction Δ_H° can be used to calculate the temperature dependence of apparent equilibrium constants K' in the same way that the standard molar enthalpy of reaction Δ_H° is used to calculate the temperature dependence of the equilibrium constant K .

The data are presented in the same format as in Part 1.¹ Thus, the following information is given for each entry in this review: the reference for the data; the biochemical reaction studied; the name of the enzyme used and its Enzyme Commission number; the method of measurement; the conditions of measurement [temperature, pH, ionic strength, and the buffer(s) and cofactor(s) used]; the data and an evaluation of it; and, sometimes, commentary on the data and on any corrections which have been applied to it or any calculations for which the data have been used. The absence of a piece of information indicates that it was not found in the paper cited. The arrangement of the data, its evaluation, and the thermodynamic conventions have been described previously.¹ In this regard one should note that equilibrium constants should be expressed as dimensionless quantities. However, the numerical value obtained for the equilibrium constant of an unsymmetrical reaction will depend upon the measure of composition and standard concentration selected for the reactants and products. Thus, for the chemical reaction

$$A(\text{aq}) = B(\text{aq}) + C(\text{aq}), \quad (1)$$

$K_c = c(B)c(C)/\{c(A)c^\circ\}$, $K_m = m(B)m(C)/\{m(A)m^\circ\}$, and $K_x = x(B)x(C)/x(A)$. Here, c , m , and x are, respectively, concentration, molality, and mole fraction, $c^\circ = 1 \text{ mol dm}^{-3}$, and $m^\circ = 1 \text{ mol kg}^{-1}$. The equilibrium constant expressed in terms of mole fractions is automatically dimensionless. Similar definitions and considerations apply to the apparent equilibrium constant K' .

This effort has been given additional impetus by the recent completion of the IUBMB-IUPAC document "Recommendations for Nomenclature and Tables in Biochemical Thermodynamics."⁴

2. Some Aspects and Uses of Thermodynamic Data on Biochemical Reactions

While a full discussion of the applications of thermodynamic data would be beyond the scope of this review, it seems useful to briefly indicate the utility of the information presented in this review. The primary motivation for many of those performing thermodynamic studies on biochemical reactions is to determine the position of equilibrium of the reaction(s) studied as well as to establish the reversibility of the reaction. This information is concisely summarized in terms of the apparent equilibrium constants given herein. These apparent equilibrium constants can be conveniently used to calculate the extent of reaction under the stated set of conditions and thus can be very useful to engineers concerned with the optimization of product yield in bioreactors. The enthalpy changes accompanying these reactions are also needed to know how much heating or cooling is required to

keep a bioreactor at its proper temperature. To perform this calculation one needs to know both the standard transformed enthalpy of reaction Δ_rH° , the change in the hydrogen ion binding $\Delta_rN(H^+)$, and the enthalpy of protonation of the buffer(s) in the bioreactor. In general, both Δ_rH° and $\Delta_rN(H^+)$ are functions of temperature, ionic strength, and metal ion concentration.

Apparent equilibrium constants obtained from studies of *in vitro* systems can also be used to calculate the position of equilibrium in metabolic processes involving several reactions. Glycolysis is probably the best example of a situation where data are available and for which such calculations have been performed.^{5,6} The results of these calculations can then be compared with information on the concentrations of the various substrates obtained from the analysis of *in vivo* systems. This comparison can provide valuable insight into the chemical machinery of living systems.

For many biochemical reactions, the apparent equilibrium constant is a function of temperature, pH, pX, and ionic strength. Thus, when performing Hess' Law and thermochemical cycle calculations, it is necessary that the data for all of the reactions in such a calculation refer to the same set of conditions. The dependencies of apparent equilibrium constants and standard transformed enthalpies of reaction on the conditions of reaction can be very complex and the reduction of such results to a common standard state generally requires auxiliary information on the binding of protons and metal ions to the various reactants as well as information on or assumptions about the activity coefficients of the species in solution. Calculations of this type have been performed by Kuby and Noltmann,⁷ Alberty,^{8,9} Guynn, Gelberg, and Veech,¹⁰ Langer *et al.*,¹¹ Goldberg and Tewari,¹² and others.

Tables of standard formation properties¹³ have proven to be a useful way of generalizing upon and presenting thermodynamic data for many chemical substances. However, tables of this type have been prepared for only limited classes of biochemical substances.^{14–16} It has recently been shown¹⁷ how it is possible to prepare tables of standard transformed formation properties for biochemical reactants (i.e., sums of species) as distinct from standard formation properties for individual biochemical species. The adenosine 5'-triphosphate series was used as a prototype for this purpose. Thus, it appears likely and desirable that several different types of thermodynamic tables will eventually appear in the literature. Clearly, the larger the scope of such tables, the more useful they are for calculating thermodynamic quantities for reactions which have not been the subject of a direct investigation.

The subjective evaluation of the data in this review consisted of the assignment of a rating: A (high quality), B (good), C (average), or D (low quality). In making these assignments we considered the various experimental details which were provided in the study. These details include the method of measurement, the number of data points determined, and the extent to which the effects of varying temperature, pH, and ionic strength were investigated. A low rating was generally given when few details of the investigation were reported. For example, in many of the papers cited, the major aim of the study was the isolation and puri-

fication of the enzyme of interest. Thus, the equilibrium data were obtained as only a small part of an investigation to characterize many of the properties of that enzyme.

3. Acknowledgments

We thank Dr. Ellen Anderson and Dr. Edgar Etz with their assistance with papers written in German and Dr. Mikhail V. Rekharsky for his help with the papers in Russian. Ms. Kari Fazio and Donna Bell provided valuable assistance in the early collection of the references containing the data and in the preliminary abstracting of information.

5. Table of Equilibrium Constants and Enthalpies of Reaction

5.1. Enzyme: thetin-homocysteine S-methyltransferase (EC 2.1.1.3)

T K	pH	$\frac{\Delta_rH(\text{cal})}{\text{kJ mol}^{-1}}$
298.15	7.1	-36.8

Reference: 62DUR/Raw

Method: calorimetry

Buffer: phosphate

pH: 7.1

Evaluation: A

Durrell *et al.* applied ionization and buffer protonation corrections and obtained $\Delta_rH^\circ(T=298.15 \text{ K}) = -36.8 \text{ kJ mol}^{-1}$ at $T = 298.15 \text{ K}$ for the

chemical reference reaction: betaine(aq)+L-homocysteine(aq)=
N,N-dimethylglycine(aq)+L-methionine(aq).

$\frac{T}{\text{K}}$	pH	$\frac{\Delta_r H(\text{cal})}{\text{kJ mol}^{-1}}$
298.15	7.1	-57.7

Reference: 57DUR/STU

Method: calorimetry

Buffer: phosphate (0.034 mol dm⁻³)

pH: 7.1

Evaluation: B

Durell and Sturtevant applied ionization and buffer protonation corrections and obtained $\Delta_r H^\circ(T=298.15 \text{ K})=-52.7 \text{ kJ mol}^{-1}$ for the chemical reference reaction: dimethylacetothetin(aq)+L-homocysteine(aq)=S-methylthioglycolate⁻(aq)+L-methionine(aq)+H⁺(aq). These results were superseded by those of Durell *et al.* [62DUR/RW]

$\frac{T}{\text{K}}$	pH	$\frac{\Delta_r H(\text{cal})}{\text{kJ mol}^{-1}}$
298.15	7.1	-52.3

Reference: 62DUR/RW

Method: calorimetry

Buffer: phosphate

pH: 7.1

Evaluation: A

Durell *et al.* applied ionization and buffer protonation corrections and obtained $\Delta_r H^\circ(T=298.15 \text{ K})=-47.3 \text{ kJ mol}^{-1}$ for the chemical reference reaction: dimethylacetothetin(aq)+L-homocysteine(aq)=S-methylthioglycolate⁻(aq)+L-methionine(aq)+H⁺(aq). This result supersedes the earlier result of Durell and Sturtevant [57DUR/STU]

$\frac{T}{\text{K}}$	pH	$\frac{\Delta_r H(\text{cal})}{\text{kJ mol}^{-1}}$
297.15	7.07	-49.3

Buffer: (Tris+HCl), (triethanolamine+HCl), and (Hepes+KOH)

pH: 8.0–8.54

Cofactor(s): $MgCl_2$

Evaluation: A

The calorimetric enthalpies of reaction given above (Cheer *et al.* actually carried out this reaction starting with ADP and phosphoenolpyruvate) were corrected for the enthalpies of protonation of the buffer using $\Delta_fN(H^+) = -1.00$. These results can be made consistent for all three buffers if one uses $\Delta_fN(H^+) = -0.91$. In such a case one obtains $\Delta_fH^\circ(T=298.15, \text{pH}=8.03) = -4.7 \text{ kJ mol}^{-1}$. Cheer *et al.* have also calculated $\Delta_fH^\circ(T=298.15 \text{ K}, I=0) = 4.4 \text{ kJ mol}^{-1}$ for the chemical reference reaction: $ATP^4(aq) + pyruvate^-(aq) = ADP^3(aq) + phosphoenolpyruvate^{3-}(aq) + H^+(aq)$.

311.15	7.00	0.25	59

Reference: 70VEE/RAI

Method: spectrophotometry

Buffer: phosphate

pH: 6.88–7.02

Cofactor(s): MgCl₂ (0.0006 mol dm⁻³)

Evaluation: B

Veech *et al.* report $K'_c c(\text{H}^+)/c^\circ = 5.9E-6$ over the pH range 6.88 to 7.02. The apparent equilibrium constant given above was calculated from this result. Also see the results of Veech [68VEE] above.

308.15	7.25	29

Reference: 89ELL

Method: NMR and enzymatic assay

Buffer: mercaptoethanol (0.014 mol dm⁻³) + Hepes (0.050 mol dm⁻³)

pH: 7.25

Cofactor(s): magnesium acetate (0.050 mol dm⁻³)

Evaluation: C

Ellington determined the ratio $\{K' \text{ (the above reaction)}/K'_{CK}\}$ to be 0.29, where K'_{CK} is the apparent equilibrium constant for the reaction: ATP(aq) + creatine(aq) \rightleftharpoons ADP(aq) + phosphocreatine(aq). The result given here was obtained using $K'_{CK}=100$ from Lawson and Veech [79LAW/VEE].

Method: spectrophotometry and fluorimetry

Buffer: potassium phosphate (0.05 mol dm^{-3})

pH: 7.0

Cofactor(s): MgCl_2

Evaluation: A

Teague and Dobson calculated $\Delta_H^\circ(\text{pH}=7.0, \text{pMg}=3.0, I=0.25 \text{ mol dm}^{-3}) = 11.9 \text{ kJ mol}^{-1}$ from the dependence of the apparent equilibrium constant on temperature. They also calculated $\Delta_f G^\circ = 51.1 \text{ kJ mol}^{-1}$, $\Delta_f H^\circ = 16.7 \text{ kJ mol}^{-1}$, and $\Delta_f S^\circ = -110.4 \text{ J K}^{-1} \text{ mol}^{-1}$ at $T=311.15 \text{ K}$ and $I_c=0.25 \text{ mol dm}^{-3}$ for the chemical reference reaction:

Langer used $K(T=298.15 \text{ K}, I=0.2 \text{ mol dm}^{-3})=2.75$ from Alberty [69ALB] for the chemical reference reaction: $\text{AMP}^{2-}(\text{aq}) + \text{ATP}^{4-}(\text{aq}) = 2 \text{ADP}^{3-}(\text{aq})$. He found that this value and his model gave a good representation of the data. These results were also given by Langer *et al.* [77LAN/GAR] with the data presented graphically.

The apparent equilibrium constant given above is based upon the stoichiometry of the reaction given here.

5.105. Enzyme: glucuronate-1-phosphate uridylyltransferase (EC 2.7.7.44)

$\frac{T}{K}$	pH	K'
303.15	8.2	0.34

Reference: 71ROB

Method: chromatography, electrophoresis, and radioactivity

Buffer: Tris (0.1 mol dm^{-3}) + HCl

pH: 8.2

Cofactor(s): Mg^{2+}

Evaluation: C

$\frac{T}{K}$	pH	K'
310.15	8.5	0.57

Reference: 66KIM/SUZ

Method: spectrophotometry and enzymatic assay

Buffer: Tris ($0.063 \text{ mol dm}^{-3}$) + HCl

pH: 8.5

Cofactor(s): MgCl_2

Evaluation: B

5.103. Enzyme: glucose-1-phosphate guanylyltransferase (EC 2.7.7.34)

$\frac{T}{K}$	pH	K'
303.15	7.8	0.25

Reference: 66VER/ROD

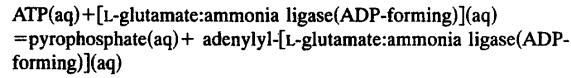

Method: enzymatic assay and spectrophotometry

Buffer: Tris

pH: 7.8

Cofactor(s): Mg^{2+}

Evaluation: C

This result was also given by Hansen *et al.* [66HAN/VER].
5.104. Enzyme: [glutamate-ammonia-ligase] adenylyltransferase (EC 2.7.7.42)

$\frac{T}{K}$	pH	K'
310.15	7.36	8.5

Reference: 70MAN/HOL

Buffer: Tris (0.1 mol dm^{-3}) + HCl

pH: 7.36

Reference: 68REE/MEN

Method: enzymatic assay and spectrophotometry

Buffer: (imidazole + HCl) and (Tris + HCl)

pH: 6.51–8.39

Cofactor(s): MgCl_2

Evaluation: B

$\frac{T}{K}$	pH	buffer	K'
298.15	6.51	none	1.75E-4
298.15	6.91	none	9.35E-4
298.15	7.00	none	8.77E-4
298.15	7.06	none	8.26E-4
298.15	7.18	none	1.19E-3
298.15	7.22	none	1.45E-3
298.15	7.39	none	5.55E-3
298.15	7.53	imidazole ($0.021 \text{ mol dm}^{-3}$)	1.0E-2
298.15	7.88	Tris ($0.023 \text{ mol dm}^{-3}$)	7.1E-2
298.15	8.19	Tris ($0.023 \text{ mol dm}^{-3}$)	0.17
298.15	8.39	Tris ($0.023 \text{ mol dm}^{-3}$)	0.50

The dependence of K' on pH is consistent with $\Delta_f N(H^+) = 2$ (see Fig. 3 of Reeves *et al.*).

$\frac{T}{K}$	pH	K'
298.15	7.24	4.9E-3

Reference: 73SUG
Method: enzymatic assay and spectrophotometry
pH: 7.24
Cofactor(s): MgCl_2 (0.0042 mol dm⁻³)
Evaluation: C

The apparent equilibrium constant given above was calculated from the concentrations given in Sugiyama's Table II.

Reference: 53LYN/OCH
Method: spectrophotometry
pH: 8.1
Cofactor(s): MgCl_2
Evaluation: C

This is an approximate result.

$\frac{T}{K}$	pH	K'
298.15	8.1	0.01

Reference: 53STE/COO
Method: spectrophotometric
pH: 8.1
Evaluation: C

This is an approximate result. The temperature is assumed to be 298.15 K.
Also see Stern [56STE] and Stern *et al.* [56STE/COO] given below.

5.107. Enzyme: aryl sulfotransferase (EC 2.8.2.1)

$\frac{T}{K}$	pH	K'
303.15	7.8	4.1

Reference: 57GRE/LIP
Method: spectrophotometry
Buffer: Tris (0.11 mol dm⁻³) + HCl
pH: 7.8
Evaluation: B

$\frac{T}{K}$	pH	K'
303.15	7.8	26.4

Reference: 57GRE/LIP
Method: spectrophotometry
Buffer: Tris (0.11 mol dm⁻³) + HCl
pH: 7.8
Evaluation: B

$\frac{T}{K}$	pH	buffer	$\frac{c(\text{MgCl}_2)}{\text{mol dm}^{-3}}$	K'
303.15	7.00	Tris (0.10 mol dm ⁻³)	0	2.8E-3

303.15	8.10	Tris (0.10 mol dm ⁻³)	0	3.9E-3
303.15	8.10	Tris (0.10 mol dm ⁻³)	0.0053	4.8E-3
303.15	9.20	glycine (0.1 mol dm ⁻³)	0	5.5E-3
303.15	9.20	glycine (0.1 mol dm ⁻³)	0.0053	3.0E-3

Reference: 56STE

Method: spectrophotometry

Buffer: Tris (0.067 mol dm⁻³) + HCl

pH: 7.0–9.2

Cofactor(s): MgCl₂

Evaluation: C

Stern recalculated the earlier data of Stern *et al.* [56STE/COO] on the assumption that only the oxo form of acetoacetyl-CoA is a substrate of 3-oxoacid CoA-transferase.

$\frac{T}{K}$	pH	K'
298.15	8.1	0.067

Reference: 67HER/JEN

Method: spectrophotometry

Buffer: Tris

pH: 8.1

Evaluation: C

This result is based upon an analysis of kinetic data.

^aIn some cases the CAS registry number refers to a salt of the substance.^bA CAS registry number has not been assigned to this substance.

7. Abbreviations

ADP	adenosine 5'-diphosphate	CoA	coenzyme A
dADP	2'-deoxyadenosine 5'-diphosphate	CTP	cytidine 5'-triphosphate
ADP- α -S	adenosine 5'-O-(1-thiodiphosphate)	GDP	guanosine 5'-diphosphate
ADP- β -S	adenosine 5'-O-(2-thiodiphosphate)	dGDP	2'-deoxyguanosine 5'-diphosphate
ATP- α -S	adenosine 5'-O-(1-thiotriphosphate)	GMP	guanosine 5'-monophosphate
ATP- β -S	adenosine 5'-O-(2-thiotriphosphate)	dGMP	2'-deoxyguanosine 5'-monophosphate
ATP- γ -S	adenosine 5'-O-(3-thiotriphosphate)	GTP	guanosine 5'-triphosphate
AMP	adenosine 5'-monophosphate	Hepes	<i>N</i> -(2-hydroxyethyl)piperazine- <i>N'</i> -2-ethanesulfonic acid
dAMP	2'-deoxyadenosine 5'-monophosphate	IDP	inosine 5'-diphosphate
ATP	adenosine 5'-triphosphate	IMP	inosine 5'-monophosphate
dATP	2'-deoxyadenosine 5'-triphosphate	ITP	inosine 5'-triphosphate
ATP- α -S	adenosine 5'-O-(1-thiotriphosphate)	Mes	2-(<i>N</i> -morpholino)ethanesulfonic acid
ATP- β -S	adenosine 5'-O-(2-thiotriphosphate)	Mops	3-(<i>N</i> -morpholino)propanesulfonic acid
ATP- γ -S	adenosine 5'-O-(3-thiotriphosphate)	NAD	β -nicotinamide-adenine dinucleotide (oxidized)
Bicine	<i>N,N</i> -bis(2-hydroxyethyl)glycine	NADH	β -nicotinamide-adenine dinucleotide (reduced)
CDP	cytidine 5'-diphosphate	NADP	β -nicotinamide-adenine dinucleotide phosphate (oxidized)
dCDP	2'-deoxycytidine 5'-diphosphate	Pipes	piperazine- <i>N,N'</i> -bis(2-ethanesulfonic acid)
CMP	cytidine 5'-monophosphate	Taps	<i>N</i> -tris(hydroxymethyl)methyl-3-aminopropane-sulfonic acid
dCMP	2'-deoxycytidine 5'-monophosphate		
Ches	2-(<i>N</i> -cyclohexylamino)ethanesulfonic acid		

dTDP	thymidine 5'-diphosphate	53STE/COO	Stern, J.R.; Coon, M.J.; del Campillo, A.; J. Am. Chem. Soc.; 75 , 1517 (1953).
dTMP	thymidine 5'-monophosphate	54BER/JOK	Berg, P.; Joklik, W.K.; J. Biol. Chem.; 210 , 657 (1954).
Tricine	<i>N</i> -[tris(hydroxymethyl)methyl]glycine	54BOW/KER	Bowen, W.J.; Kerwin, T.D.; Arch. Biochem. Biophys.; 49 , 149 (1954).
Tris	tris(hydroxymethyl)aminomethane	54GOL	Goldman, D.S.; J. Biol. Chem.; 208 , 345 (1954).
dTPP	thymidine 5'-triphosphate	54NOD/KUB	Noda, L.; Kuby, S.A.; Lardy, H.A.; J. Biol. Chem.; 210 , 83 (1954).
UDP	uridine 5'-diphosphate	54ROS/GRU	Rose, I.A.; Grunberg-Manago, M.; Korey, S.R.; Ochoa, S.; J. Biol. Chem.; 211 , 737 (1954).
UMP	uridine 5'-monophosphate	54STA	Stadtman, E.R.; in "The Mechanism of Enzyme Action"; W.D. McElroy and B. Glass, eds.; John Hopkins Press, Baltimore, Maryland (1954) pp. 581-598.
dUMP	2'-deoxyuridine 5'-monophosphate	55BLA/WRI	Black, S.; Wright, N.G.; J. Biol. Chem.; 213 , 27 (1955).
UTP	uridine 5'-triphosphate	55BUC	Bücher, T.; Methods Enzymol.; 1 , 415 (1955).
